

Google warned about security flaws in Android, how to stay safe

A security flaw has been discovered in the Android operating system

Google has warned users about multiple security flaws in the Android operating system. Cybercriminals can remotely attack smartphones running Android 12 to Android 15 operating systems to exploit security flaws. As a result, there is a risk of theft of personal files or information on the smartphone. According to Google, security flaws in Android's system components are quite serious. And so it is possible to secretly add harmful code to any smartphone remotely by exploiting the flaws. As a result, cybercriminals can collect various phone information without the user's knowledge,

Google released the new security patch in January shortly after it discovered security flaws in Android's system components. The company also advised all Android users to use the quick security patch to stay safe from cyber attacks.
